GEN AI ARCHITECT JOURNEY · PHASE-003

SauceDemo Product Automation

Sign in, extract every product, report it

Track	Playwright - browser automation
What it does	Extracts products, screenshots them, writes Excel
Single file	Playwright_Web_Automation.py
Needs	Playwright + Chromium · openpyxl
Folder	Phase-003-Robotic-Process-Automation-(RPA)/Playwright Automation/Playwright Automation Project

1. What it does

Signs in to the SauceDemo training store, visits every product page, and produces a formatted Excel report with one screenshot per product.

- Selects elements by SauceDemo's stable **data-test** attributes rather than by position.
- Collects product name, price, detail-page URL, date, time, screenshot filename, and status.
- Overlays the product URL onto the page before each screenshot, because browser screenshots do not include the address bar.
- Creates Windows-safe, unique screenshot filenames.
- Saves partial results and per-product errors, so one failure never costs the whole report.
- Formats and freezes the Excel header, adds a filter, sizes the columns, and makes the URLs clickable.

Why the URL overlay matters

A browser screenshot captures the page, not the chrome around it - so the address bar is absent and the image alone cannot prove which page it came from. Drawing the URL onto the page before capture makes each screenshot self-evidencing.

2. Setup and run

POWERSHELL

```
cd "Playwright Automation\Playwright Automation Project"
python -m venv .venv
.\.venv\Scripts\Activate.ps1
python -m pip install playwright openpyxl
python -m playwright install chromium

python Playwright_Web_Automation.py
```

3. Options

POWERSHELL

```
python Playwright_Web_Automation.py --output "output\products.xlsx"
python Playwright_Web_Automation.py --screenshots "output\screenshots"
python Playwright_Web_Automation.py --help
```

--**output** changes the workbook path and --**screenshots** the screenshot directory. The parser also exposes --**headless**; the current implementation launches with **headless=False**, so the browser stays visible until that launch setting is changed in the source.

4. Credentials

The public SauceDemo training credentials are built into the script and can be overridden for the current session:

TEXT

```
Username: standard_user
Password: secret_sauce
```

POWERSHELL

```
$env:SAUCEDEMO_USERNAME = "standard_user"
$env:SAUCEDEMO_PASSWORD = "secret_sauce"
python Playwright_Web_Automation.py
```

These are public demo credentials

SauceDemo publishes them for training. They are safe to commit precisely because they unlock nothing real - which is exactly why a practice project should use a site like this rather than a live account.

5. Troubleshooting

Symptom	Fix
Login fails	Verify internet access and SauceDemo availability
Chromium is missing	Run python -m playwright install chromium
Product locators fail	SauceDemo may have changed its data-test values or routes
The workbook cannot be written	Close products.xlsx in Excel, or pass a different --output path
