GEN AI ARCHITECT JOURNEY · PHASE-003

Bengaluru Weather Bot

Chrome to Notepad, without an API

Track	PyAutoGUI - desktop automation
What it does	Captures live weather and saves a dated report
Single file	Assignment1_Weather_Data.py
Needs	Windows · Chrome · Internet access
Folder	Phase-003-Robotic-Process-Automation-(RPA)/PyAutoGUI Automation/Assignment-1-PyAutoGUI_Weather_Data

1. What it does

Opens AccuWeather in Chrome, reads the current conditions, and saves them to a dated Notepad file.

FLOW

```
Launch Chrome -> open AccuWeather -> copy page text -> parse readings  
-> open Notepad -> paste formatted data -> save the dated .txt
```

The report can carry temperature, RealFeel, condition, wind, gusts, humidity, indoor humidity, dew point, pressure, cloud cover, visibility, cloud ceiling, capture time, and source URL. When a value cannot be identified the script writes **Not found** rather than guessing or crashing.

2. How it was specified

The bot was written from a deliberately precise specification. Stating each step before writing code is what kept the implementation short and made the failure cases obvious.

Step	Requirement
1	Open the Chrome browser
2	Open the AccuWeather Bengaluru current-weather page in a new tab
3	Copy the values inside Current Weather - not the heading
4	Open Notepad and start a new document
5	Paste the parsed weather data
6	Save as {Today Date}_Weather_Data.txt in the project folder

Step 3 carries all the difficulty

Copying the page is trivial. Identifying *which* of the copied lines are the current readings is the actual work - which is why the parser is built around labelled regular expressions rather than fixed line offsets that would break the first time the page reflowed.

3. Setup and run

POWERSHELL

```
cd "PyAutoGUI Automation\Assignment-1-PyAutoGUI_Weather_Data"  
python -m venv .venv  
.\.venv\Scripts\Activate.ps1  
python -m pip install pyautogui pyperclip pillow  
  
python Assignment1_Weather_Data.py
```

Close or minimise unrelated windows and keep the terminal visible. Do not touch the mouse or keyboard while the bot works. To abort, move the pointer quickly to the upper-left corner of the primary display.

4. Output and configuration

The report is written to the current working directory as `YYYY-MM-DD_Weather_Data.txt`. Running again on the same date may replace that day's file after Notepad's overwrite dialog.

Setting	Meaning
WEATHER_URL	Selects the AccuWeather location and page
PROJECT_FOLDER	<code>os.getcwd()</code> - output lands where Python was launched, not necessarily beside the script
Page-load sleep	15 seconds by default; increase it on a slow link

The parsing patterns target AccuWeather's English Bengaluru page. A different location, language, unit system, or layout may require updating the regular expressions.

5. Troubleshooting

Symptom	Fix
No webpage text was copied	Wait for the page to finish loading, dismiss cookie or consent dialogs, and make sure Chrome is focused
Current Weather section was not found	Verify the configured URL opened and the page layout has not changed
Several values show Not found	AccuWeather may have changed its labels or formatting
File saved in an unexpected place	Start PowerShell in this folder before running the script
Actions occur in the wrong application	Close extra Chrome and Notepad windows, then rerun without changing focus

6. Limitations

This project intentionally demonstrates GUI automation. It is more sensitive to focus and page layout than an API-based weather integration would be, and it should not be used as a source for safety-critical weather decisions.

Next

Continue to the Apple Stock Price Bot, which adds Excel to the same desktop-automation pattern.
