GEN AI ARCHITECT JOURNEY · PHASE-003

Apple Stock Price Bot

Google Finance to a formatted Excel report

Track	PyAutoGUI - desktop automation
What it does	Captures the AAPL quote and builds a dated workbook
Single file	daily_report_bot.py
Needs	Windows · Chrome · Microsoft Excel
Folder	Phase-003-Robotic-Process-Automation-(RPA)/PyAutoGUI Automation/Assignment-2-PyAutoGUI_Bot_Stock_Price

1. What it does

Reads Apple's live quote from Google Finance and drives Microsoft Excel to produce a dated, formatted report.

1. Opens the Apple (**AAPL**) quote on Google Finance in Chrome.
2. Copies the visible page text and extracts the current stock price.
3. Opens Excel and creates a row with the captured data.
4. Saves a dated workbook such as **daily_report_2026-07-28.xlsx**.
5. Saves a screenshot of the final Excel sheet.

Column	Contents
Date & Time	When the quote was captured
Stock Company Name	Apple Inc.
Stock Data	The extracted USD price
Source link	The Google Finance URL
Comment	Run notes

2. Setup and run

POWERSHELL

```
cd "PyAutoGUI Automation\Assignment-2-PyAutoGUI_Bot_Stock_Price"
python -m venv .venv
.\.venv\Scripts\Activate.ps1
python -m pip install -r requirements.txt
```

Run a safe preflight first - it checks only the applications and the output directory, without opening the website or taking over the desktop:

POWERSHELL

```
python daily_report_bot.py --check
python daily_report_bot.py
```

Dated reports are never overwritten

If a report for the current date already exists, the bot appends the current time to the new filenames instead of replacing the earlier run. Evidence of a previous run is never silently destroyed.

3. Output

TEXT

```
output/
daily_report_YYYY-MM-DD.xlsx
daily_report_YYYY-MM-DD_screenshot.png
```

The code formats the header and auto-fits the populated columns through Excel keyboard shortcuts.

4. How it works

1. Locates Chrome and Excel in their standard Windows installation paths.
2. Opens the Apple quote in a new Chrome window and copies the page text.
3. Finds a USD price near the **Apple Inc** heading.
4. Opens a blank Excel workbook and pastes a tab-separated header and row.
5. Saves the workbook and captures the visible sheet.

5. Notes and limitations

- Chrome and Excel must be installed in their standard Windows locations.
- If the page loads slowly, increase **PAGE_LOAD_SECONDS** near the top of the script.
- Close any Chrome consent dialog before retrying if the bot reports that the Google Finance data was not copied.
- The bot sends **Ctrl+N** after Excel starts. Where that opens the **New** template page instead, it selects the **Blank workbook** tile automatically.
- It is intentionally specific to Apple. Change **STOCK_SYMBOL**, **EXCHANGE**, **COMPANY_NAME**, and the extraction assumptions together if adapting it.

Not financial advice

Stock quotes may be delayed. This is an educational automation project, not a trading system. Save other work and leave the desktop alone during a run - the fail-safe is the upper-left screen corner.

Next

Continue to the Playwright track, where selectors replace screen coordinates.
